

## **SMASH Publication Guidelines**

Knut Olsen and David Nidever

March 2015

This document briefly describes the publication guidelines for the SMASH collaboration. It is aimed at making sure that refereed SMASH papers recognize all of the contributions that go into making published results from SMASH possible. It will also be taken into account as we embark on eventual joint SMASH+DES projects in collaboration with DES.

There are two kinds of authors to consider for SMASH papers:

1. Science leads: those who contribute directly to the scientific analysis for the paper
2. Architects: those who contribute to the infrastructure of the SMASH survey

### **Preparing a science project with SMASH data**

Team members who wish to work on a specific science project using SMASH data should announce their intent to do so at the earliest possible stage, allowing ample opportunity for other SMASH team members to join the project. Announcements of projects should be made via the SMASH team email exploder, and basic information on the project maintained at the SMASH team website.

SMASH team members wishing to join an announced project should indicate what they plan to contribute, or describe what expertise they have that might be helpful as the project develops.

If a project requires expertise from outside the SMASH collaboration, external collaborators may be invited to join the project with the approval of the SMASH PI.

Once a draft paper of a SMASH science result is ready, it should be circulated to the full SMASH team with a request for comments and a request for Architects to identify whether or not they wish to be added as co-authors on the paper. The author list on the paper draft should at this point include everyone who contributed meaningfully to the project; these are the Science lead authors. Under normal circumstances, at least two weeks should be allowed for responses to a request for comments.

SMASH team members who contribute comments that help to significantly improve the paper should be considered for inclusion in the Science lead author list, at the discretion of the first author and/or the SMASH PI. SMASH Architects who have requested co-authorship should also be added to the author list.

Authors of the paper should list the Science leads first, followed by the ordered list of Architects (see below). Architects who contributed scientifically to the project should be placed in the appropriate order among the Science lead authors.

For papers done in collaboration with other survey teams, Science leads will be listed first, followed by Architects of SMASH and the external survey team, in an order agreed upon by the leadership of SMASH and the collaborating survey team.

Once a final version of a paper is ready, there should be a request for a final round of comments and an announcement of the intended submission date.

Disputes about authorship on SMASH papers will be resolved by the SMASH PI.

### **SMASH Architects**

Architects can earn co-authorship on SMASH papers by their own request. Architect status is based on significant contributions in any of the following areas:

1. Leading and managing the survey and its operations, or aspects of it
2. Survey operations, including performing observing, writing or operating survey reduction pipelines, calibration work, data quality control, and planning
3. Additional data management and analysis work of broad use to the project, such as designing and performing star/galaxy separation techniques, artificial star tests, etc.
4. Communication, including internal project communication (e.g. maintaining websites, leading telecons, organizing team meetings) and representing the project externally
5. Writing additional proposals to earn observing time for the survey or survey followup
6. Writing proposals to fund survey work

The areas for contributions above are listed in rough weighted order, the reasoning being that without project leadership, there would be no project; without observing, there would be no data; without data management, there would be no data products for science; etc.

The order of Architects will be maintained by SMASH leadership (Nidever & Olsen) and periodically reviewed. It will roughly reflect the level of individual contributions weighted by the above order. The current (March 2015) ordered list of Architects is: David Nidever, Knut Olsen, Alistair Walker, Kathy Vivas, Robert Gruendl, Katie Kaleida, Ricardo Muñoz, Bob Blum, Abi Saha, Blair Conn, and Eric Bell. We recognize that several other team members have also made contributions towards SMASH infrastructure, or may do so in the future. Team members may be considered for inclusion on the Architects list upon request to SMASH leadership.

### **Special papers**

The SMASH overview paper will include all team members, with the Architects above listed first followed by an alphabetical list of additional team members. Non-team members who have contributed to observing will be included as co-authors on the overview paper.

overview paper. These co-authors are currently Joshua Frechem, Gustavo Medina, Vaishali Parkash, and Jacqueline Séron.
